“Walking the Extra Mile”

## Foreword

The Agriculture Statistics 2005 is the second publication of the Department of Agriculture. An attempt has been made to present a comprehensive data concerning agriculture development to meet the data needs for various clients. The publication contains data on the agricultural area, production levels and constraints faced by farmers. Also, information related to agriculture through secondary data sources has been compiled and presented

We hope that the data in this publication will provide a better understanding of agriculture and will help make informed decisions for development. This is our ongoing effort to improve the database. There are constraints in collecting and managing the information.

The Department of Agriculture commends the inputs provided by the various agencies. We also extend our appreciation to the Dzongkhag Administrations for their support in the implementation of field data collection.

We hope that the data will be useful for policy makers, planners, administrators, managers, researchers and those who are involved in the development of RNR sector.

Lastly, I take this opportunity to congratulate my colleagues in the department and Dzongkhags who have taken this initiative to successfully bringing out this publication. Their efforts will go a long way in improving the database in agriculture.

Sherub Gyaltshen  
**DIRECTOR GENERAL**

Date: 5 July 2007.

## **1. Introduction**

The rural agriculture sample surveyed was initiated and conducted by Department of agriculture in 2005. The first agriculture census was conducted in 2004 covering the entire rural household. The data obtained have been processed, analyzed and presented at the Dzongkhag and geog level, which have been eventually summed up at the national level. The publication features area, production and yield in respect of principle crops of food-grains, oil seeds, pulses and spices, and horticultural crops. Further, the publication also provides information on food security levels and farm constraints.

### **1.1 Objectives**

The objectives of the survey are:

To establish reliable information on crop production and land use for planning and monitoring of agriculture development programmes.

The immediate objective is to generate data needed for preparation of the plans, programs and to assess the achievements.

Prepare time series data of Land use and agriculture production trend.

### **1.2 Organization of the Survey**

The survey is focussed on the rural farming household. IMS, DoA took the lead in the conceptualization, preparing of questionnaires and co-ordinating the sample survey. All attempts has been made to cover 201 geogs however, due to unavoidable circumstances Laya geog under Gasa could not be enumerated. The extension staff collected the data by using the set of questionnaire provided to them.

1. The rural agriculture data collected data are on
2. Land use status
3. Area and production of
4. Cereals
5. Oilseeds and spices
6. Pulses
7. Tree crops
8. Vegetables
9. Agricultural constraints

### **1.3 Survey Methodology**

#### Sampling design

The survey adopted a systematic random sampling to select the rural farming households. A 10 percent sample was applied uniformly to all the Geogs irrespective of the sizes and economic activities undertaken. No further stratification was adopted.

#### Sampling Units and Sampling Frames

All the 201 Geogs in the country served as the domain for the sample survey. All the Geogs were included in the sample survey in order to cover different ecological resources endowment, and development stages.

A household is the lowest sampling unit. The household lists for each Geog served as the sample frame from which a 10 percent sample was chosen for interview.

#### Sampling Procedures

The IMS, DoA in consultation with the DAOs and extension agents selected the sample households based on the household lists maintained in the geog centre. The sample was drawn from the fifth households from the list. The rest were similarly identified by using systematic random sampling by picking every fifteenth farmer to identify the required 10 % sample. This sample list was distributed to the enumerators for identification and interview. In the event that the sampled farmer was not available for interview, then the next farmer from the same locality was selected.

#### 1.4 Field Operation

Since consistency of data depends on methodology of collection, it is highly important to brief the extension worker on proper procedures of data collection and development of sample frame. This will avoid data collection problems in the field and discrepancies of data at the time of compilation. Therefore, prior to the survey we have conducted briefing to all the Geog Agriculture Extension Agents. The extension agents are briefed on the contents of questionnaire, methodology and sample list. Questionnaires were also distributed along with the sample lists. The survey reference period was for the year 2005 and the enumeration was conducted from December 2005 till January 2006.

### **1.5 Data Validation, Processing and Analysis**

There were three stages of data validation steps. The first step was the process of eliminating and data inconsistencies at geog level by the extension workers by comparing the yield from the annual crop cut. These inconsistencies data enumeration were removed. The second validation was the process of deleting the data that did not make any sense. The affect from the removal of such data is insignificant since the number of cases barely exceeded 5 percent of the total sample. The third validation was on local units measurements to standard unit. The farmers still use local measurement units that differ from place to place. Instead of reporting in Kg and Acre they have reported in langdo, bags, baskets, etc. As a result, it not only poses difficulties in compilation but also affects the quality of data in terms of area and production. However, this year we have used the National Statistical Bureau publication on standardization of local units 2002 for standardization of commodities reported by the farmers.

Finally, the data entry was designed using Ms. Access. We organized two weeks workshop for all 20 Dzongkhags agriculture data managers in Paro with the surveyed questionnaires for final validation. The data entry was done at Rinpung Computer Training Centre at Paro in July 2006 with adequate training by the department.

#### 1.6 Data Limitations

This publication attempts to present the data related to the rural farming households for the year 2005. Since this is the first uniform 10 percent sample survey, there are some inherent weaknesses. The publication presents data for the year 2005 and does not provide time series data.

It should also be noted that the data were collected by people with different social and educational background. Although various capacity development activities were conducted to enhance their skills and knowledge in conducting the surveys and data entry, one cannot completely forget the human nature associated with committing mistakes by chance or by design.

The primary source of data are the farmers who are not educated and do not keep records of their land area, production and many farmers under reports due to fear of taxation. The data collected are based on the memory they can remember as far back as possible. Lastly, like any other data gathering activities, the results are also subject to sampling and non-sampling errors. Utmost care has been considered to keep such errors to minimum level.

### **1.7 Estimate of survey results.**

It may be noted that the estimate of the rural household will refer the rural agriculture households for the year 2005. The survey covered 5,334 rural households out of 6,182 sample household. The 1.4 percent non response or absentees was due to problems with the listings and some of the farmers are away on pilgrimage and on holidays. This agriculture statistics represent the total extrapolated for 61,825 rural household for the year 2005. The figure is the estimate based on the sample. However, we did not include nor publish the figures if the geogs have reported less than 3 samples. The sample represents the rural households only. Unlike in 2000 and 2004 statistics, the harvested area and production are high due to resettlement programs in the southern Dzongkhags.

## Bumthang Dzongkhag Agriculture Statistics 2005

Geog: Chhoekor

Crop Name	Harvested Area (acre)	Production (Kg)	Yield/kg
Paddy	33	52,976	1,600
